# 시큐리티 - JDBC 연동 및 taglib 사용

## 프로젝트명: B09cSecurityJDBC

#### 준비사항

- 기존 B09bSecurityCustomLogin 프로젝트를 복사한 후 이름을 B09cSecurityJDBC 로 변경한다.
- 컨텍스트 루트 경로와 settings.gradle 를 변경한다.
- Refresh Gradle Project 를 눌러 적용한다.

#### 의존설정 추가

```
24 dependencies {
       implementation 'org.springframework.boot:spring-boot-starter-jdbc'
25
       implementation 'org.springframework.boot:spring-boot-starter-security'
26
27
       implementation 'org.springframework.boot:spring-boot-starter-web'
28
      compileOnly 'org.projectlombok:lombok'
      runtimeOnly 'com.oracle.database.jdbc:ojdbc11'
29
       annotationProcessor 'org.projectlombok:lombok'
30
      providedRuntime 'org.springframework.boot:spring-boot-starter-tomcat'
31
       testImplementation 'org.springframework.boot:spring-boot-starter-test'
32
       testImplementation 'org.springframework.security:spring-security-test'
33
34
       implementation 'javax.servlet:jstl'
      implementation 'org.apache.tomcat.embed:tomcat-embed-jasper'
implementation 'org.springframework.security:spring-security-taglibs'
35
36
37 }
```

```
implementation 'org.springframework.boot:spring-boot-starter-jdbc' runtimeOnly 'com.oracle.database.jdbc:ojdbc11' implementation 'org.springframework.security:spring-security-taglibs'
```

gradle을 reflash 한다.

## 테이블생성

```
1--스프링 시큐리티 JDBC 커스트마이징
2 create table security_admin(
3 user_id varchar2(30) primary key,
4 user_pw varchar2(200) not null,
5 authority varchar2(20) default 'ROLE_USER', /* 회원권한 */
6 enabled number(1) default 1 /* 활성화여부. 0인 경우 로그인 되지 않는다. */
7);
```

## 더미데이터 입력

```
insert into security_admin values ('user1', '1234', 'ROLE_USER', 1);
insert into security_admin values ('user2', '1234', 'ROLE_USER', 0);
insert into security_admin values ('admin1', '1234', 'ROLE_ADMIN', 1);
insert into security_admin values ('admin2', '1234', 'ROLE_ADMIN', 0);
commit;
```

단, 스프링 시큐리티에서는 패스워드를 반드시 암호화 한 후 입력해야 한다. 따라서 아래와 같이 처리하면 된다.

#### src/main/java/com/edu/springboot/B06SecurityApplication

```
7 @SpringBootApplication
 8 public class B06SecurityApplication {
 9
       public static void main(String[] args) {
10⊝
           SpringApplication.run(B06SecurityApplication.class, args);
11
12
           String passwd =
13
14
               PasswordEncoderFactories.createDelegatingPasswordEncoder()
15
                   .encode("1234");
           System.out.println(passwd);
16
17
       }
18 }
```

해당 코드를 실행할때는 우클릭 -> Run as -> Java application을 클릭하면 된다.

그러면 Java 프로그램처럼 실행되고 콘솔에서 결과를 볼 수 있다.

```

{bcrypt}$2a$10$x4kA1EFGn35FqtG0hJLnmO9zzP4YqaDE23wGmtJkgD5F2hb8CeXtG
```

암호화된 패스워드를 복사한 후 쿼리를 수정하고 더미데이터를 입력한다.

복사할때 {bcrypt} 부분을 제외하고 복사한다.

이미 입력한 상태라면 update문을 사용하면 된다.

## 프로젝트 설정: resources/application.properties

```
1 # TE MAY Server.port=8586

2 server.port=8586

3 # JSP MAY Spring.mvc.view.prefix=/WEB-INF/views/
5 spring.mvc.view.suffix=.jsp

7 **
8 # oracle MAY Spring.datasource.driver-class-name=oracle.jdbc.OracleDriver spring.datasource.url=jdbc:oracle:thin:@localhost:1521:xe
11 spring.datasource.username=musthave
12 spring.datasource.password=1234

13
```

#### 시큐리티 설정: com/edu/springboot/auth/WebSecurityConfig.java

기존 인메모리 방식을 사용했던 users(), passwordEncoder() 메서드는 주석으로 처리한다.

```
76⊜
       @Autowired
       private DataSource dataSource;
77
78
79⊜
       @Autowired
       protected void configure(AuthenticationManagerBuilder auth)
80
               throws Exception {
81
           auth.jdbcAuthentication()
82
               .dataSource(dataSource)
83
               .usersByUsernameQuery("select user_id, user_pw, enabled "
84
                        + " from security_admin where user_id = ?")
85
               .authoritiesByUsernameQuery("select user_id, authority "
86
                        + " from security_admin where user_id = ?")
87
               .passwordEncoder(new BCryptPasswordEncoder());
88
89
       }
90 }
```
